AGENT OPERATIONAL GUIDE – SIGNAL INTERCEPTION & ANALYSIS

CLASSIFIED. OFFICIAL OPERATIONAL MANUAL: RADIO PACKET SNIFFER
V.1.08. PROPERTY OF THE CENTRAL INTELLIGENCE AGENCY PACIFICA ISLES
DIVISION

TABLE OF CONTENTS

1. Introduction: Clandestine Radio in the Pacifica Isles

- **The Rise of Illegal Transmissions: Contextualizing the post-1945 suppression and modern youth countercultures.**
- **Security Risk Assessment.**
- **The Case for Signal Hunting: Objectives for maintaining stability in the formal incorporation era (post-1952).**

2. Operational Guide: The Radio Packet Sniffer

- **Phase I: Tone Patching**
- **Phase II: Station Selection**
- **Phase III: Real-Time Monitoring**

3. Glossary of Terms

4. Index of Software Controls

CLASSIFIED. OFFICIAL OPERATIONAL MANUAL: RADIO PACKET SNIFFER

Note to Agents: Adherence to these protocols is mandatory for the continued suppression of un-American sentiment within the district. Failure to maintain signal lock during Phase I will result in a frequency reset and potential loss of data.

1. Introduction: Clandestine Radio in the Pacifica Isles

In the American Pacifica Isles (formerly Japan), the occupation administration faces a rising tide of illegal transmissions. While the Imperial Family was annihilated in 1945 and Japanese identity has been systematically suppressed, anonymous youth countercultures have emerged to challenge American oversight.

Security Risk Assessment

These clandestine radio networks represent a significant security risk because they employ low-power hidden transmitters, often operating from abandoned factory basements, to evade detection. Their broadcasts frequently include historical fragments and banned language samples designed to incite unrest and undermine social stability.

They function as off-grid communication channels for anonymous hacker and insurgent cells, enabling coordination beyond monitored networks. By circumventing state-controlled AM frequencies, they spread dissident information outside official oversight, weakening regulatory control and amplifying subversive narratives.

The Case for Signal Hunting

Agents must actively hunt these signals to maintain the stability of the Pacifica Isles. These broadcasts are not merely for entertainment; they are the primary method by which un-American sentiment is cultivated among the youth who have never known a Japan before the 1952 formal incorporation.

2. Operational Guide: The Radio Packet Sniffer

The Radio Packet Sniffer is an authorized tool designed to run within the standard OS environment to intercept these illegal streams¹⁰.

Phase I: Tone Patching

To bypass the security filters on underground relays, the agent must perform a "Tone Patch".

1. Listen to the Pattern: The software will detect a series of tones (Low, Mid, High, or Whistle).
2. Input Synchronization: Use the Tone Patch Bay to replicate the sequence exactly.
3. Signal Lock: Each successful pattern increases the Transmission Power meter. Failure to match the sequence results in signal loss and requires a frequency reset.

Phase II: Station Selection

Once the sniffer is online and synchronized, the agent can monitor several known pirate frequencies¹⁶. Available stations vary by the time of day in Tokyo.

- Tokyo Yamoto Forever (9970 kHz): A primary target for surveillance.
- Synth Rebels (9150 kHz): High-frequency signal often containing encoded data and banned musical content.
- Sunrise Radio (909 kHz): An early morning broadcast commonly used for coordination.

Phase III: Real-Time Monitoring

Agents should utilize the Message Log to track system responses and incoming packet data. The software will provide a "Hack Status" update and indicate when the signal is "Streaming Live."

3. Glossary of Terms

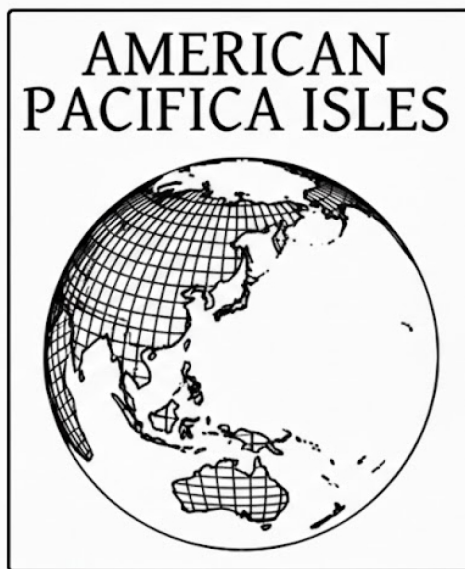

- American Pacifica Isles: The formal designation for the US-administered islands formerly known as Japan
- Bradsonic: A major American-founded technology manufacturer whose hardware forms the basis for local communications
- Hacker Youth: The target demographic for clandestine broadcasts; American-raised, English-speaking individuals who utilize technology to seek out forbidden heritage
- LAPC-1: The standard soundcard interface used to stream audio through the agent's workstation
- Pattern Sniffer: The active software component that detects and decodes the tone-based handshakes of pirate relays
- Squelch Filter: A software-defined barrier used to manage signal noise during transmission power breaches
- VHF/AM: The primary frequency ranges monitored for dissident activity

4. Index of Software Controls

Command / Control	Function
LEFT / RIGHT ARROWS	Select Tone Button (LOW, MID, HIGH, WHISTLE)
ENTER	Patch Selected Tone / Tune Station
SPACE	Replay Pattern (3 chances) / Stop Playback
UP / DOWN ARROWS	Browse Message History / Select Radio Channel
ESCAPE	Emergency Exit / Close Interface
